

## μC/OS PORTING KIT

OS Changer μC/OS™ Porting Kit is a C/C++ source-level virtualization technology that allows you to easily re-use your software developed using μC/OS APIs on another OS, while providing real-time performance. It eliminates the manual porting effort, saves money and shortens the time to market. OS Changer can also be used to simulate the μC/OS Interface on a host machine. OS Changer Interface connects to your existing application that was developed on μC/OS while the OS Abstractor Target Specific Module (specific to your target OS) provides the connection to the OS you are moving to.

### OPTIMIZED CODE GENERATION: OPTION ONE

- Legacy porting tool to easily import your μC/OS applications into AppCOE
- Perform your porting & simulation on Windows/Linux host machine with the provided GNU tools for x86
- Generate optimized μC/OS Interface code for your target, specific to your application
- Generate project files for your target IDE/tools environment
- Enable target profiling of the μC/OS Interface and of the application functions to collect valuable performance data and generate comparative performance reports
- Selectively optimize each μC/OS Interface function for performance based on its usage in your application
- Automatically generate initialization and configuration code based on the settings you chose in the GUI-based wizard

### FULL SOURCE PACKAGE GENERATION: OPTION TWO

- Use with your preferred IDE/tools instead of the AppCOE development environment
- Provides a Porting Kit in a source code format which contains all the μC/OS Interface functions for a specific target OS
- Requires manual configuration and initialization instead of using the AppCOE GUI-based wizard

## µC/OS PORTING KIT

### STEP ONE • Choose an option

### STEP TWO

#### Option One Optimized Code Generation

Your µC/OS App:  
Import using the legacy  
porting tool in AppCOE

Porting steps:  
Replace headers, Combine main ( )

Run/debug application  
using emulator on host

Configure target OS, Profiler,  
Interface Optimizer & system settings

Generate code  
for target OS

Output:  
• Unmodified application source  
• µC/OS Interface source

Native compiler

Output:  
• OS Abstractor API objects/library  
• µC/OS API objects/library  
• Application objects/libraries

Continue to **STEP TWO**

#### Option Two Full Source Package Generation

Your  
µC/OS App

Porting steps:  
Replace headers,  
Combine main ( )  
and Initialize app

Native  
compiler

Generate source  
package from AppCOE  
and perform manual  
configuration

Output:  
• OS Abstractor API library  
• µC/OS API library  
• Application objects/libraries

Continue to **STEP TWO**

Linker

Your  
µC/OS App  
executable

Download/run  
on your target OS

Generated Profiler  
data (optional)

View data using  
AppCOE Profiler

## Technical Highlights

### Includes a Process Feature

- > Port your application to a single or multiple processes utilizing the user shared region provided for your global variables
- > Create a new process by compiling the application separately or by launching it from your main application
- > Provides software-based process features, even if the underlying target OS does not offer support
- > Applications can pre-allocate heap memory during process creation
  - \* Set maximum limits regarding the amount of heap memory each application can use to prevent applications from using up all of the system memory and impacting other applications

### API Flexibility

- > OS Abtractor APIs also available for use in your  $\mu$ C/OS application
- > OS Changer  $\mu$ C/OS Interface can be used within a single or across multiple applications

### Thread Pooling

- > Applications can pool threads to increase platform robustness and performance by eliminating the overhead associated with actual task creation and task deletion at run-time

### Mission Critical Features

- > Applications have the ability to asynchronously recover from fatal software errors through a soft reset by rolling the stack back to the start of the application

### Highly Scalable

- > The AppCOE GUI-based wizard reads your application to custom generate optimized  $\mu$ C/OS Interface code that is specific to your application resulting in increased performance and reduction of memory footprint

### Target Hardware Independence

- > Products support any target hardware supported by your target OS architecture, including 32/64 bit & SMP/UP architectures

### In-house OS Support

- > Can easily be extended to support your in-house OS

## $\mu$ C/OS Interface API Coverage & Target OS Support

You can find the supported  $\mu$ C/OS APIs here:

[https://www.mapusoft.com/wp-content/uploads/documents/Release\\_Notes-ucos-APIs.pdf](https://www.mapusoft.com/wp-content/uploads/documents/Release_Notes-ucos-APIs.pdf)

Below are the target operating systems supported by the OS Changer  $\mu$ C/OS Porting Kit:

Android <sup>®</sup>	LynxOS-178 <sup>®</sup>	Nucleus <sup>®</sup>	ThreadX <sup>®</sup>
eCOS <sup>®</sup>	micro-ITRON <sup>®</sup>	QNX Neutrino RTOS <sup>®</sup>	Unix <sup>®</sup>
Linux/POSIX	Freescaler MQX <sup>®</sup>	RT Linux <sup>®</sup>	VxWorks <sup>®</sup>
LynxOS <sup>®</sup>	NetBSD <sup>®</sup>	Solaris <sup>®</sup>	In-House
LynxOS-SE <sup>®</sup>	FreeRTOS <sup>™</sup>
